The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-6, 18-23 and 33-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over McMurry in view of Howell.

McMurry teaches a control circuit for a motor 14 that includes a complex snubber arrangement in combination with contactor elements 10 and 34. Capacitors 22 and 24

Art Unit: 2836

are said to act as shunt capacitor snubbers, while diodes 26 and 28 operate to polarize the charging and discharging of the capacitors (see col.2 lines 40-45). The McMurry device differs from the claims by not having a resistor/diode parallel branch in series with an energy storage device (capacitor).

Howell teaches a switching device having ports 10 and 12 that includes resistor R2 in parallel with diode D2, with the "R2D2" branch connected in series with capacitor c2.

It would have been obvious to one of ordinary skill in the art to combine the teachings of Howell into a device of the type taught by McMurry to meet the claims, because both teachings are related by being switching arrangements using snubber circuits, with Howell teaching that it is known to use a less complicated arrangement under circumstances where cost or complexity might be an issue.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Seki et al teaches a capacitor/resistor/diode arrangement connected directly across a switch. The Seki patent is dated June of 1981.

Claims 13-17 and 29-32 are allowed.

Claims 7-12, 24-28 and 37-40 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: The above mentioned claims recite a second diode in parallel with the energy

storage element, which is a limitation not taught or fairly suggested by the prior art of record in this Application.
